Guided Digital Medicine™

The most edifying ground-breaking two-day seminar you have ever attended.

Management of the most difficult patients which have not responded to any other therapy except FCT® and why.

An overview and introduction to FCT®.

This is not a product or technology-oriented presentation.

Dear Colleague,

The truth is that the sickest chronic patients are the ones who represent the true measure of efficacy and value of the therapeutic approach in all chronic diseases. The sobering reality, however, remains that in spite of an ever growing number of therapeutics and technology in both conventional and alternative medicines, there are millions of very ill patients out there who have failed to respond to either one. Even worse, as most of the time their responses amounted to deterioration or trading for new symptoms.

As our planet and lifestyles become more unhealthy and iatrogenicity of medical treatments grow, so has the number of these unfortunate people who have yet to meet their demand for effective care. Even a population with less severe illnesses is being far from optimally managed as, often, behind the reduction or cover-up of symptoms, there is usually negligible progress being attained in the most essential – state of health – with a permanent dependency on therapeutics, and serious illnesses surfacing over time.

The main reason for these deficiencies is the absence of a sound and effective scholastic model for medical practice but a utilization of specialty-oriented approaches or their haphazard combinations instead which, in spite of being based on seemingly plausible ideas, in reality, all rest on incomplete knowledge. Because of the latter, plausible ideas are viewed only in one-sided fashion or from their “sunny” “making sense” side while their concurrent flaws remain overshadowed. So, logistically, when the practices based on these plausible ideas fail or result in only partial successes, the latter only serves to sustain self-deceit in assuming that true success can be readily attained by simply augmenting skills or adding “better and new” products or interventions. However, this merry-go-round that the presenter himself looped through in the past as a physician, has consistently flunked since all these “better”, “more” and “new” entities are being born malformed in the first place by the very crippled models which conceive them, thus, completing a circle of futility with no end in sight.

Not surprisingly, recent statistics show that instead of a decline in chronic diseases, there’s been only a rise in iatrogenicity and mortality, for both conventional and alternative medicines. This seminar will introduce an outline of this new model and practice of medicine based on a great deal of invaluable knowledge from both the exact sciences and other relevant non-medical and medical disciplines that elude medical training in both camps. ¹ Both the virtues and ostensible shortcomings of the corresponding conventional and alternative approaches, the correct objectives, means and direction of therapy, become automatically clear and logical. It will demonstrate practical and novel diagnostic and therapeutic tools for implementation in daily practice and how to make your own practice and specialty far more successful and, therefore, profitable.

The professional benefits and monetary savings in abandoning pursuits of needless technology, products or curriculums in the future will be enormous. Not the least of it, the great majority of our student medical professionals have found this system to be of great benefit to their own and their family’s health.

“The problem lies not in the intentions, nor in the dedication of individuals, but as so often in the history of science, from a limitation in the prevailing paradigm or model that governs and limits thinking in any given era.”

Thomas Kuhn, PhD (physics) Professor, Philosophy of Science
